11	Prof.Dr. SADETTİN KAPUCU	Design a tremor reduction device.A wearable device for reducing trembling reduces it by internally producing forces that cancel or decrease the magnitude of trembling experienced by a person who wears it. The device may be worn on a wrist, arm, ankle, or leg. The device may be composed of multiple housings, which can be flexibly connected. Each housing member has a weight that is translatable along the axes of proximity and distal proximity, and the neutral position between proximity and distal proximity. Following the imposition of a force having a component along the axis, a biasing means returns the mass to the neutral position (see WO 2018/044381 patent for more information). To solve such a problem, it is required to design and build a wearable tremor reduction device (not the same device as described in WO 2018/044381) to do a similar job. (This project may require the purchase of some things to build a prototype. Those who are willing to study this project should be aware of this.)	Mech. Eng. Electrical and Electronics Eng.
